Analysis of Process Quality
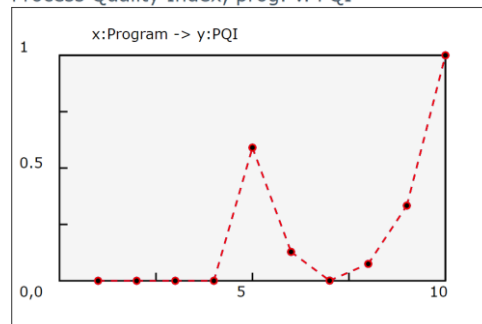

Here is the data collect from 10 program.
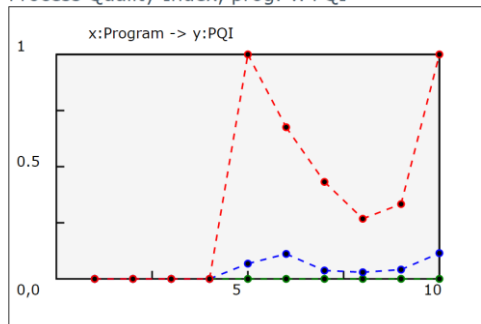

Class	Myself

I think the most improvement after learning this course is the structure of the program. I used to write program just to finish only one problem. When the same problem comes in other program I need to write it one more time. But with the program05 to program08 I found out that if the program is written to be reused and well structured, the productivity will increase so much and will save a lot of time and effort for me. Even though writing a program prepare to be reused in the future will cause some more effort in that program but will save a lot more effort in the next program if I can reused the code. I will try to write code that seems will used frequently in a well structure and make a function for other program to access and reuse.
